Galaxy mergers, recoiling SMBHs & AGNs

Galaxy mergers, recoiling SMBHs & AGNs

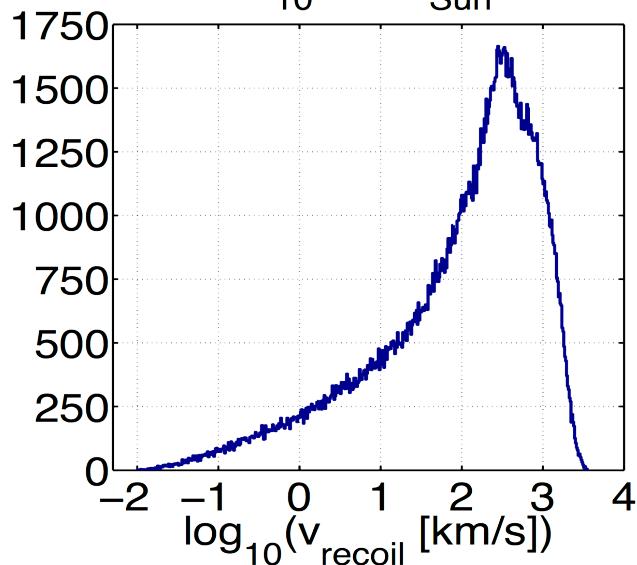

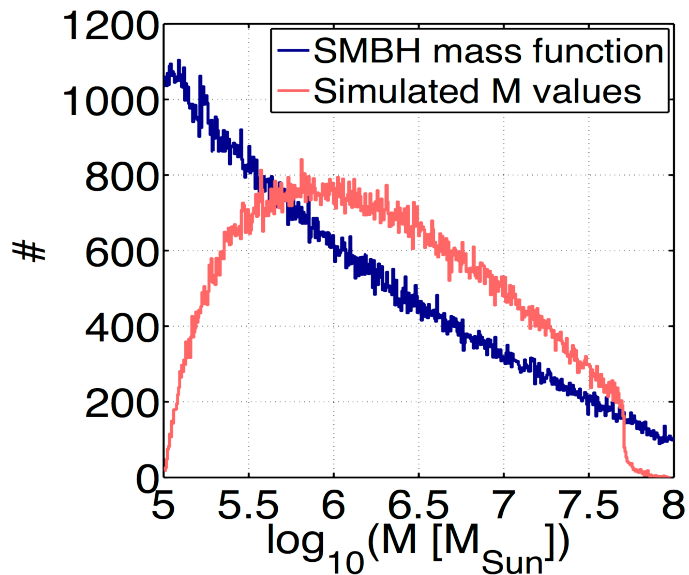

Galaxy mergers, recoiling SMBHs & AGNs

Galaxy mergers, recoiling SMBHs & AGNs

Recoil dynamics

- To calculate v_{recoil} magnitudes, we adopted the analytical formulae given in **Baker+ 2008**
- Masses of merging SMBHs randomized from mass function given in **A&R 2002**
- Spins isotropically oriented with magnitudes randomized from observationally inferred distribution given in **Reynolds 2013**
- v_{recoil} orientations were chosen to be isotropically distributed

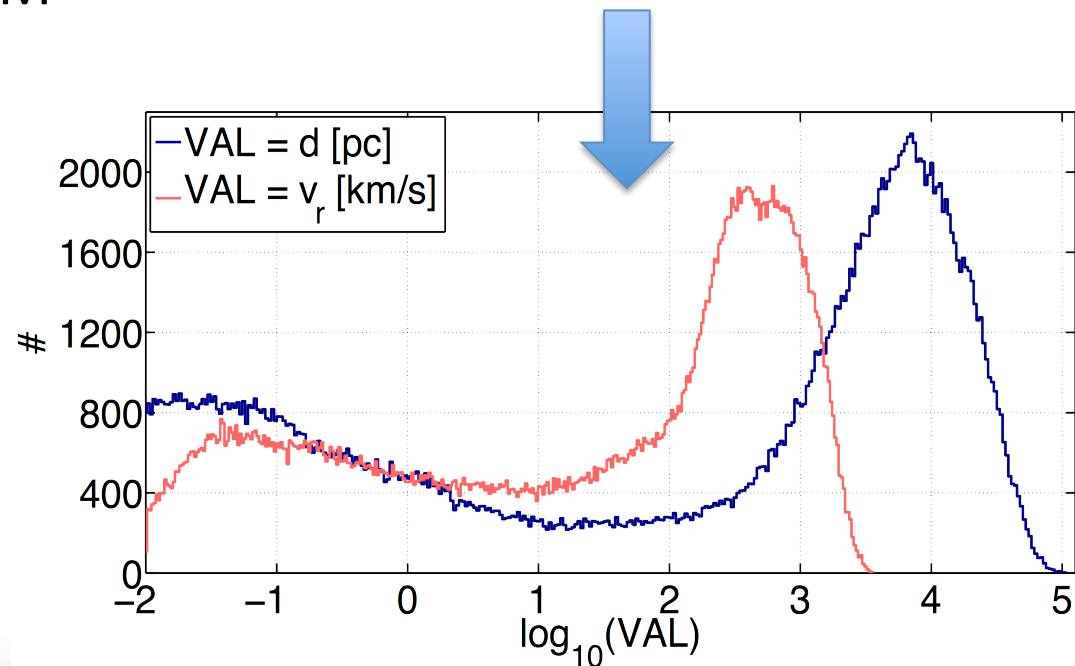

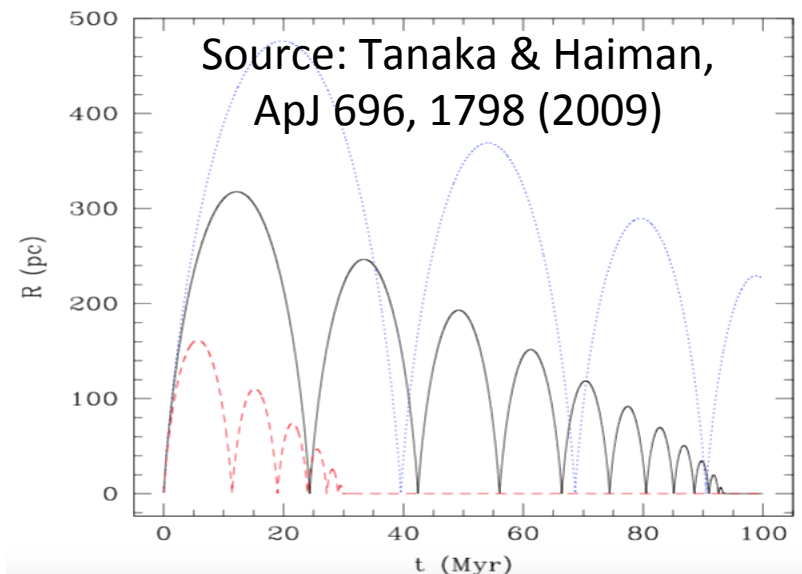

SMBH trajectories

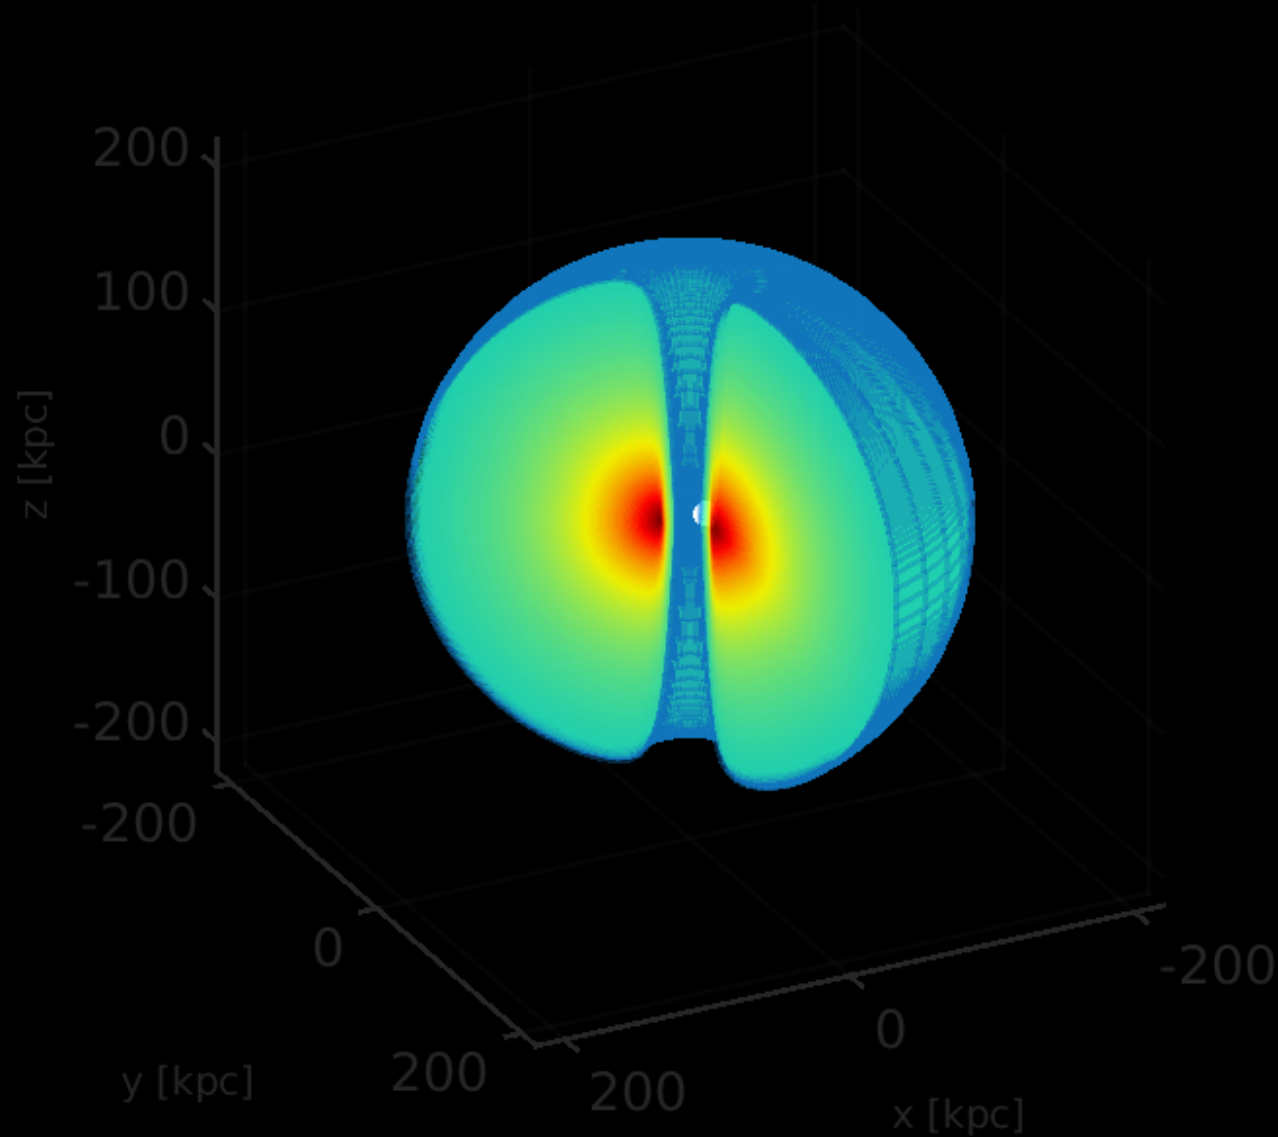

- We adopted the analytical model by **M&Q 2004**
- Dynamical friction due to SIS mass distribution with $\sigma \sim M^{1/4}$

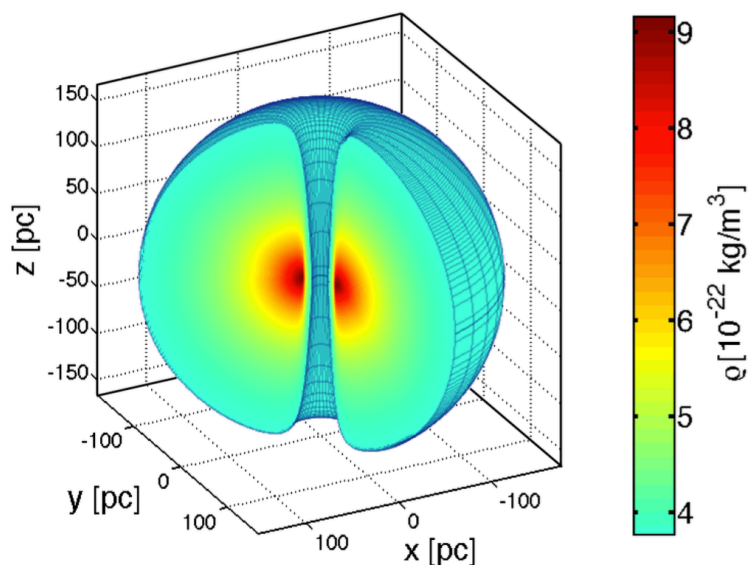

SMBH trajectories

- We adopted the analytical model by **M&Q 2004**
- Dynamical friction due to SIS mass distribution with $\sigma \sim M^{1/4}$
- Only parameters: M , v_{recoil}
- Radial distances and velocities at random times

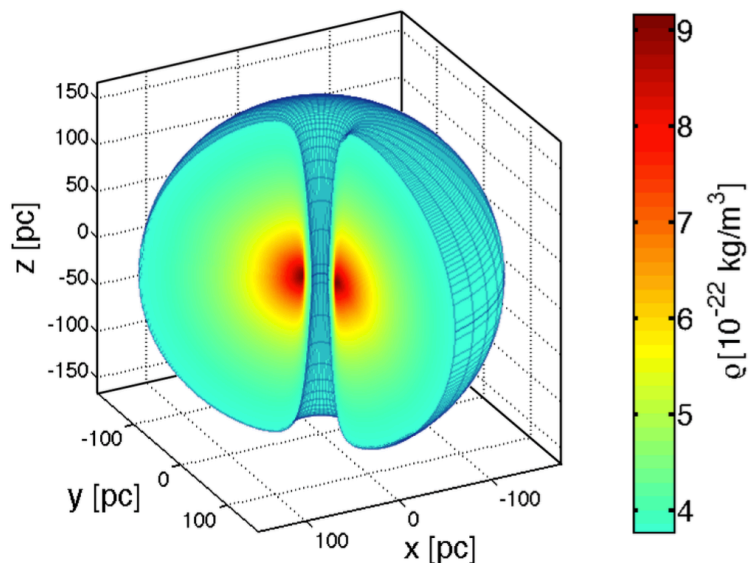

Dusty torus model

- Smooth dust torus model by **Schartmann+ 2005**
- Torus is the result of stellar winds and ejection of planetary nebulae by nuclear star cluster
- Only parameters: M and M_*

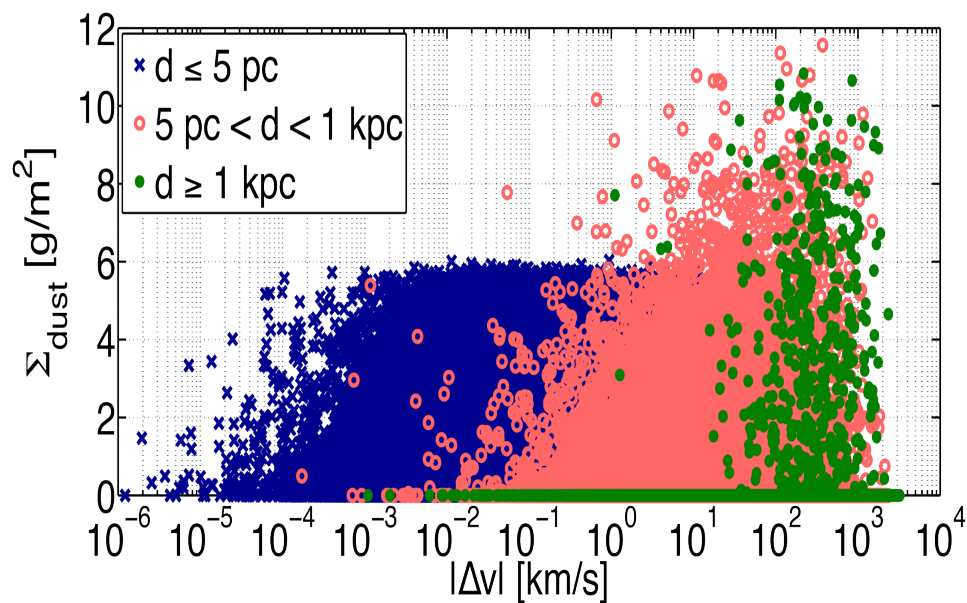

Dusty torus model

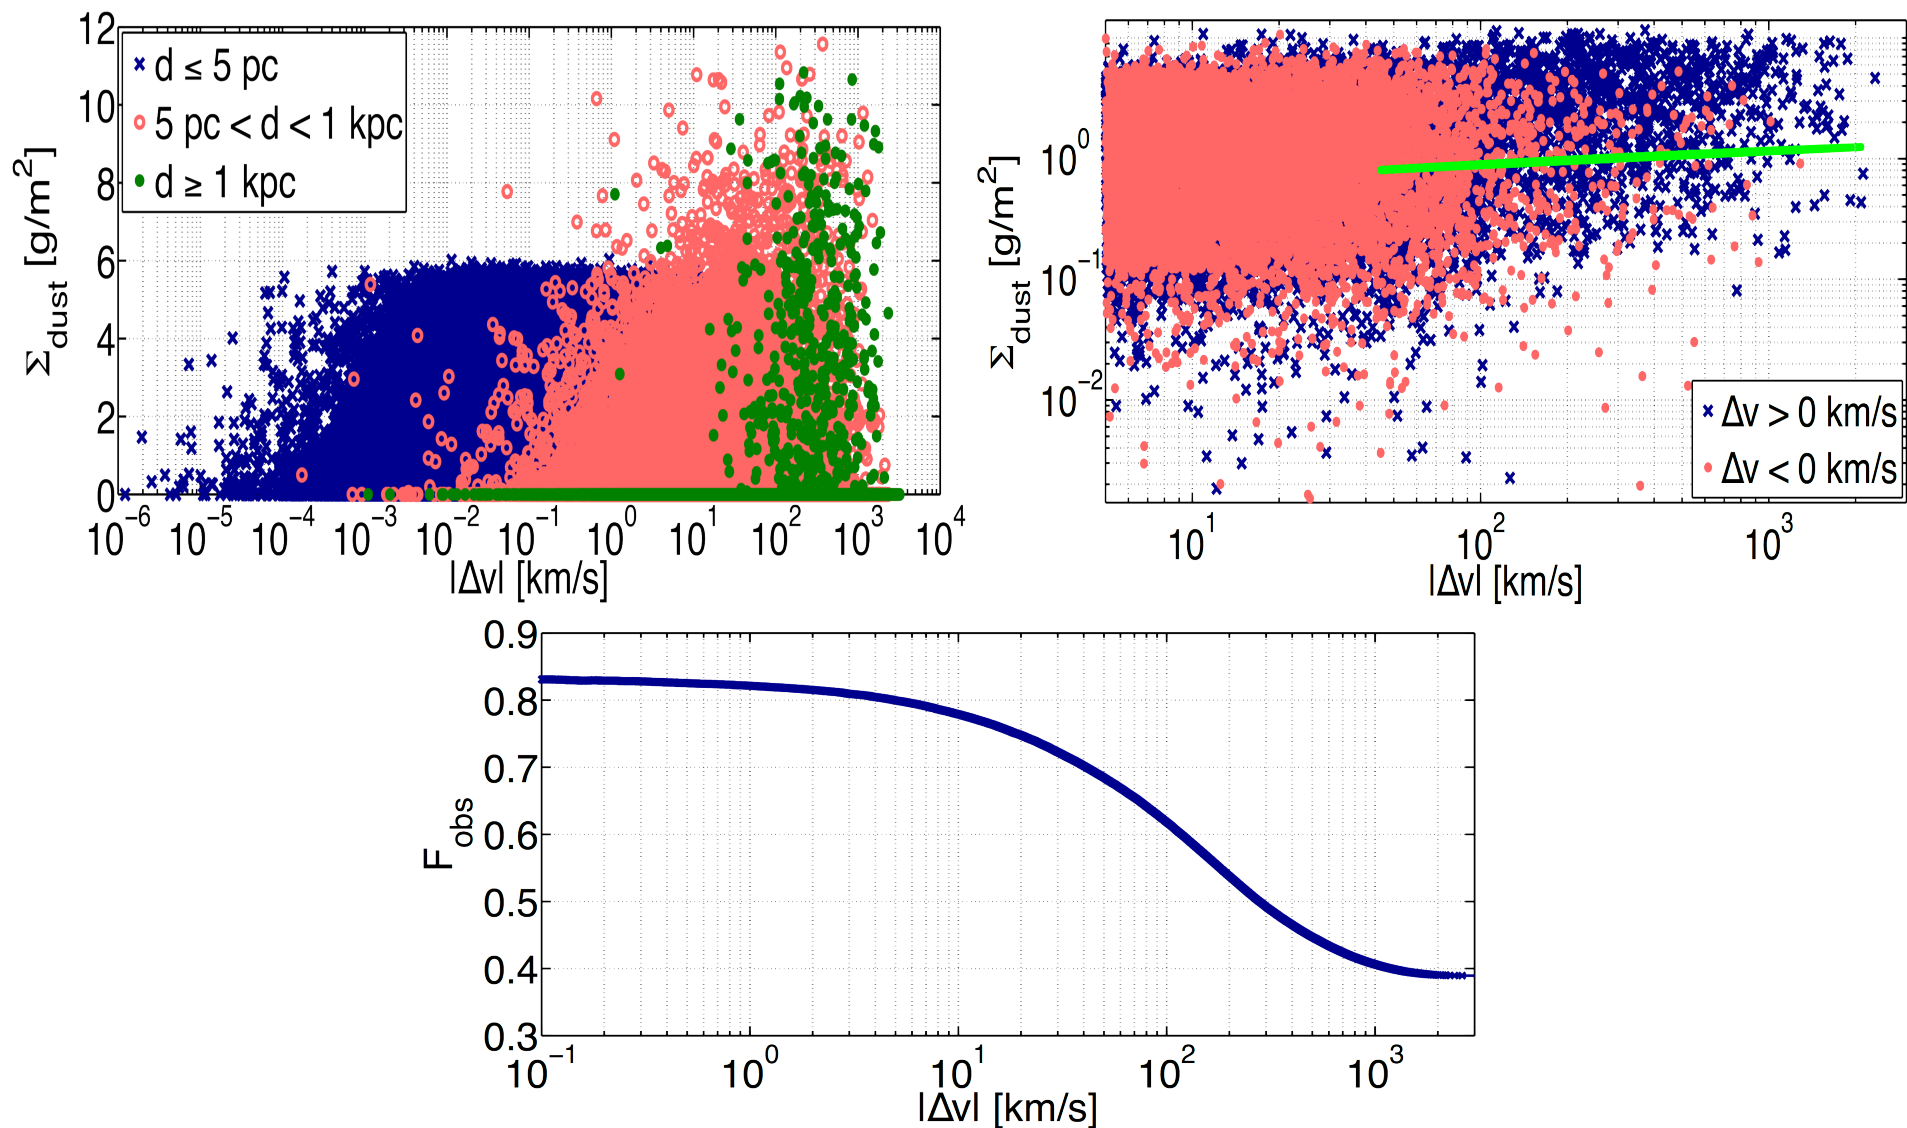

- Smooth dust torus model by **Schartmann+ 2005**
- Torus is the result of stellar winds and ejection of planetary nebulae by nuclear star cluster
- Only parameters: M and M_*

Observational tests

Observational tests

The effect of random Gaussian errors

Realistic σ_Σ values have minor effect on the $\Sigma_{\text{dust}} - |\Delta v|$ correlation

Ongoing work

- Using SDSS DR12 catalog of $\sim 300,000$ QSOs
- SDSS-BOSS spectra publicly available
- Dust column density measure (Ledoux+ 2015):

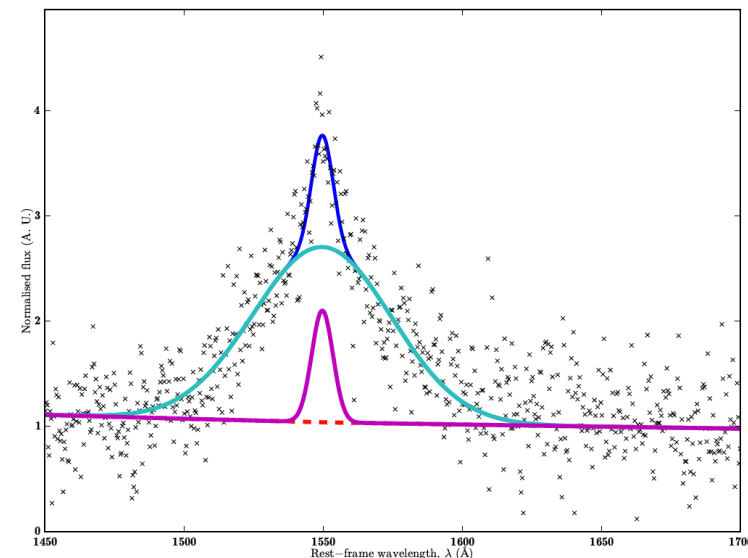

$$\Sigma_{\text{dust}} \propto \Delta(g-i) \equiv (g-i) - \langle (g-i) \rangle_z$$

- Peculiar velocity measure (Bonnig+ 2007):

$$\Delta v = \frac{z_B - z_N}{1 + z_N} c$$

- Spectral lines we use: narrow and/or broad CIV 1549, H β 4863, OIII 5007

STAY TUNED!
